

Download and convert wind data archive for running WW3 model

1. CFSR products

- go to <https://rda.ucar.edu/datasets/ds094.1/index.html#!access>
- select "Get a Subset"

| Description Data Access Documentation Metrics | | | | |
|---|-----------------------------------|----------------------------|----------------------|--------------------------------------|
| Mouse over the table headings for detailed descriptions | | | | |
| Data File Downloads | | Customizable Data Requests | Other Access Methods | NCAR-Only Access |
| Web Server Holdings | Globus Transfer Service (GridFTP) | Subsetting | THREDDS Data Server | Central File System (GLADE) Holdings |
| Web File Listing | Request Globus Transfer | Get a Subset | TDS Access | GLADE File Listing |

- select the desired time interval and the northward (v) and eastward (u) components of the windfield:

Temporal Selection: 2020-02-20 00:00 to 2020-03-31 00:00
● Valid Time ○ Initialization (Reference) Time

Parameter Selection: (selecting no parameters has the same effect as selecting all parameters)

- | | |
|--|---|
| <input type="checkbox"/> Best (4 layer) lifted index | <input type="checkbox"/> Precipitable water |
| <input type="checkbox"/> Categorical freezing rain (yes=1; no=0) | <input type="checkbox"/> Precipitation rate |
| <input type="checkbox"/> Categorical ice pellets (yes=1; no=0) | <input type="checkbox"/> Pressure |
| <input type="checkbox"/> Categorical rain (yes=1; no=0) | <input type="checkbox"/> Pressure reduced to MSL |
| <input type="checkbox"/> Categorical snow (yes=1; no=0) | <input type="checkbox"/> Relative humidity |
| <input type="checkbox"/> Cloud water mixing ratio | <input type="checkbox"/> Sea surface height relative to geoid |
| <input type="checkbox"/> Convective available potential energy | <input type="checkbox"/> Sensible heat flux |
| <input type="checkbox"/> Convective precipitation rate | <input type="checkbox"/> Snow phase change heat flux |
| <input type="checkbox"/> Dewpoint temperature | <input type="checkbox"/> Specific humidity |
| <input type="checkbox"/> Downward longwave radiation flux | <input type="checkbox"/> Stream function |
| <input type="checkbox"/> Downward shortwave radiation flux | <input type="checkbox"/> Surface lifted index |
| <input type="checkbox"/> Geometric depth below sea surface | <input type="checkbox"/> Temperature |
| <input type="checkbox"/> Geopotential height | <input type="checkbox"/> Total cloud cover |
| <input type="checkbox"/> Ground heat flux | <input type="checkbox"/> Total precipitation |
| <input type="checkbox"/> Ice cover | <input type="checkbox"/> U-component of current |
| <input type="checkbox"/> Ice thickness | <input checked="" type="checkbox"/> u-component of wind |
| <input type="checkbox"/> Latent heat flux | <input type="checkbox"/> Upward longwave radiation flux |
| <input type="checkbox"/> Maximum temperature | <input type="checkbox"/> Upward shortwave radiation flux |
| <input type="checkbox"/> Minimum temperature | <input type="checkbox"/> V-component of current |
| <input type="checkbox"/> Momentum flux, u-component | <input checked="" type="checkbox"/> v-component of wind |

Then you may want to:

- download the data directly in netcdf (instead of .grib2):

Refine Your Selections:

- **Input Data Format:** WMO_GRIB2
- **Output Format:** ☐ Same as input ☒ Converted to netCDF ☐ Converted to CSV
- **Valid Date Range:** 2020-02-20 00:00 to 2020-03-31 00:00

- and select the data within a box:

• **Grid:** 0.5° x 0.5° from 0E to 359.5E and 90N to 90S (720 x 361 Longitude/Latitude)

• **Spatial Selection:** Data within a bounding box

Interactive Map Instructions:

- Use the 'Pan Map' option to drag and center the map on your area of interest
- Use the 'Draw Box' option to drag a box around your area of interest. You can also manually enter bounding latitudes and longitudes in the text boxes.

North*: 75
West*: -98
East*: 13
South*: 0

*Latitudes and longitudes must be specified in whole degrees

Zoom: - ||| +
☐ Pan Map ☒ Draw Box

The required data are:

- wind components 10 m above ground
- for 1h forecast to 6h forecast

• **Parameter(s):** All available
u-component of wind
v-component of wind

• **Vertical Level(s):** All available
Specified height above ground: 10 m

• **Gridded Product:** All available
1-hour Forecast
2-hour Forecast
3-hour Forecast

Then you may want to:

- compress your monthly netcdf files
- and group them into a single archive file

Submit Your Request:

According to the selections that you have made, your subset request matches **123 RDA data files**. You will receive this number of files, except that these files will only contain data records that match your selections. The total uncompressed volume is estimated at **261.86 GBytes**. Please make sure that you can handle this volume of data before you submit your request or choose a compression option below.

Data Compression Options:

☐ none ☒ gzip (.gz) ☐ bzip2 (.bz2) ☐ Unix (.Z) ☐ Zip (.zip)

File Combination Options:

If you choose an option, many smaller files will be combined into fewer larger files using the method you choose. This will reduce the number of files that you will need to download from our server, but you will need to be able to separate the files on your end.

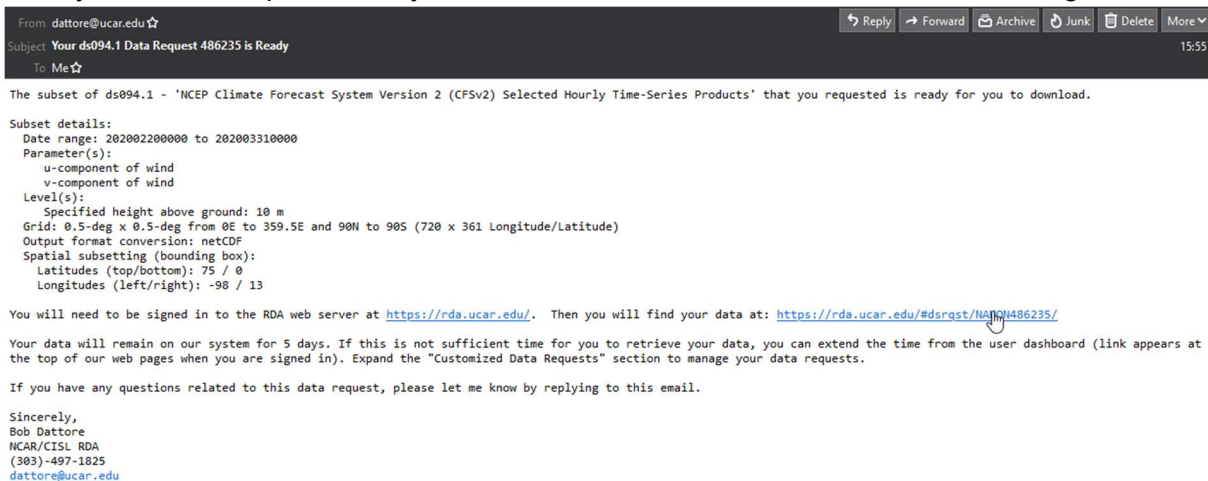

☐ none ☒ Unix tar

Download Method:

☒ Web download
☐ Globus transfer: You will be prompted to select a destination endpoint after submitting your request. The Globus transfer will be submitted automatically when your data are ready.

Submit Request Start Over

After your data was processed you will receive an email with a link for downloading the data:

The the archive file will contain monthly netcdf files :

```
[anahon@centaurus 2019_JFM]$ tar xvf wnd10mx0.5.cdas1.201812-201903.grb2.nc.tar
[anahon@centaurus 2019_JFM]$ gzip -d wnd10mx0.5.cdas1.201*
> wnd10mx0.5.cdas1.201812.grb2.nc
> wnd10mx0.5.cdas1.201901.grb2.nc
> wnd10mx0.5.cdas1.201902.grb2.nc
> wnd10mx0.5.cdas1.201903.grb2.nc
```

then the following python code should help to read the time and required variables for ww3

for n, file in enumerate(files):

print(file)

nc = netcdf4.Dataset(file)

t_ref = np.datetime64('1900-01-01T00:00:00')

**valid_date_str = ["".join(nc.variables['valid_date_time'][i].astype(str).tolist()) for
i in range(len(nc.variables['valid_date_time']))]**

```

valid_date_time = np.array([datetime.strptime(d, "%Y%m%d%H") for d in
                             valid_date_str], dtype='datetime64[s]')
valid_date_dt = valid_date_time - t_ref
time = valid_date_dt.astype(float)/24/60/60
print(time[0])
if n == 0:
    idate = np.array([1900, 1, 1, 0])
    lat_vec = nc.variables["lat"][:]
    lon_vec = nc.variables["lon"][:]
    u = nc.variables["U_GRD_L103"][:]
    v = nc.variables["V_GRD_L103"][:]
    lon = lon_vec
    lat = lat_vec
    for i in range(len(lat_vec)-1):
        lon = np.append(lon, lon_vec)
    lon = np.reshape(lon, (len(lat_vec), len(lon_vec)))
    for i in range(len(lon_vec)-1):
        lat = np.append(lat, lat_vec)
    lat = np.reshape(lat, (len(lon_vec), len(lat_vec)))
    lat = np.transpose(lat)

```

2. GFS products

The GFS forecast and analyse archive can be access here:

<https://www.ncdc.noaa.gov/data-access/model-data/model-datasets/global-forecast-system-gfs>

GFS Forecasts

| Model | Grid/Scale | Period of Record | Model Cycle | Output Timestep | Data Access Links |
|-------|---------------------|--|--------------------------|------------------------------|---|
| GFS | 004 (0.5°) - Domain | 18May2020–Present online, since 10Oct2006 in archive | 4/day: 00, 06, 12, 18UTC | 3-hourly, +000 to +192 hours | HTTPS TDS AIRS |

For the ~last 12 months, the data is accessible through an ftp server (HTTPS option). The data is splitted into model output timestep (~90MB). Older data is only accessible through the AIRS archive. It is necessary to create a request to access the archive.

■ Global Forecast System model (GRIB-2) Grid 4

Select UTC Cycle (Hour)

Date Submitted 05/05/2021

Order Summary [View Summary](#)

Files in the archive are available in grib2 format with a single file for each of the four daily runs of the model. Each file contains ALL atmospheric variables and for the ENTIRE globe, which represents ~6GB per file.

*grib2 format can be process efficiently with the NOAA wgrid2 software, accessible here:

<https://www.cpc.ncep.noaa.gov/products/wesley/wgrib2/index.html>

wgrib2.exe allows the user to efficiently split the downloaded archive, select the desired model timesteps, variables, and geographical box. Then it is possible to concatenate various files into a single grib2 archive and to convert it into netcdf file.

So to download the wind data for running the equivalent of a 24h OPENCoastS forecast, the following script was written which accept in argument the ftp directory accessible after the user has created a request to AIRS. As in the above figures, the script assumes the request only consists of the '00' cycle, i.e., model run at 00UTC.

curl_wgrib2.sh:

```

rm temp*file *.nc
rm *.grb2 *.tar
rm file_list
curl --output file_list --list-only $1

counter=0
while read f
do
  (( counter++ ))
  echo $counter
  echo $1$f
  file_to_download="curl -O $1$f"
  eval ${file_to_download}
  tar_archive="tar -xvf $f"
  eval ${tar_archive}
  rm *.tar
  rm temp_1_file
  for g in *.grb2
  do
    echo $g
    ../wgrid2/v3.0.2/wgrib2.exe $g -match ':(UGRD|VGRD):10 m above ground:|:PRMSL:mean sea
level:|:TMP:surface:)' -match ':(anl|(3|6|9|12|15|18|21) hour fcst):' -append -new_grid_winds earth -new_grid latlon -
98:223:0.5 0:151:0.5 temp_1_file
  done
  ../wgrid2/v3.0.2/wgrib2.exe temp_1_file -append -new_grid_winds earth -new_grid latlon -98:223:0.5 0:151:0.5
temp_2_file
  rm *.grb2
done <./file_list
../wgrid2/v3.0.2/wgrib2.exe temp_2_file -netcdf file.nc

```

For this particular request the script was run as follow:

./curl_wgrib2.sh ftp://[ftp.ncei.noaa.gov/pub/has/model/HAS011911356/](ftp://ftp.ncei.noaa.gov/pub/has/model/HAS011911356/)

It was tested on windows, in a Git_Bash shell, after having previously downloaded the version 3.0.2 of wgrid2 (../wgrid2/v3.0.2/wgrib2.exe).

The created file.nc should then be slightly modified to be used for ww3, as the time is given in seconds after 01-01-1970, when ww3 expects days after 01-01-1900. Also, the lat and lon vectors were transformed into matrix as done in the python script for the CFSR data.
